

Test Completion Report

The Final Verdict

 **Author:** Georgia Antoniou

 **Tags:** QA, Documentation, Release

 **Reading Time:** 3 min

TL;DR

The **Test Completion Report** is the summary document sent at the end of a testing cycle.

It answers the most important question for the stakeholders: **"Is this product safe to release?"**

The Core Concept

After days or weeks of testing, management doesn't want to read 500 individual Test Cases. They want the highlights.

This report summarizes:

1. **What we tested** (Scope).
 2. **What we found** (Bug Summary).
 3. **Our Recommendation** (Go or No-Go).
-

The Medical Report Analogy

Think of the software as a **Patient** in a hospital.

- **Daily Status:** "Patient ate lunch," "Patient slept well." (This is like daily Jira updates).
- **Discharge Report (Completion Report):**
 - - "Patient is healthy enough to go home."
 - "Treatment is finished."
 - "Warning: Patient still has a mild cough (Low Severity Bug), but it's safe to leave."

The doctor signs this paper to officially release the patient. The QA signs the Report to release the software.

The Anatomy of the Report

A good report is one page long and includes these 5 sections:

1. Executive Summary

A brief overview. *"We tested the Payment Feature. Testing is complete."*

2. Test Metrics (The Numbers)

- Total Tests Planned: 100
- Tests Passed: 95

- Tests Failed: 5
- **Pass Rate: 95%**

3. Defect Summary (The Bugs)

- Critical: 0 (Must be 0 to release).
- High: 0.
- Medium: 2.
- Low: 3.
- *Note: We list the Open Bugs here so stakeholders know the risks.*

4. Exit Criteria Check

Did we meet our goals?

-  No Critical Bugs.
-  All platforms (iOS/Android) tested.
-  Code coverage > 80%.

5. The Verdict (The Conclusion)

-  **GO:** Ready for Release.
 -  **CONDITIONAL GO:** Release, but fix the remaining bugs in a patch next week.
 -  **NO-GO:** Do not release. Too unstable.
-

Real World Example: The "Dark Mode" Update

Subject: QA Sign-off for v2.4 (Dark Mode)

Summary:

Testing for Dark Mode is complete on iOS and Android.

Results:

We executed **50** test cases. **48** Passed. **2** Failed.

Open Issues:

1. (Low) The "Settings" icon is hard to see in Dark Mode on iPhone SE.
2. (Low) A typo in the "About Us" text.

Conclusion:

Since there are no functional crashes, QA recommends a **GO** for release. We will fix the icon in v2.5.

Why This Matters

This document is my insurance policy.

If I say "GO" and the system crashes, it's my fault.

If I say "NO-GO" and list the Critical bugs, but the manager releases it anyway, I have proof that I warned them.

It turns "Quality" from a vague feeling into hard data.
